1. Secondary syphilis
2. If someone infected with syphilis does not begin proper treatment when the hard chancre appears, then 6-8 weeks later he gets a rash on the skin and on mucous membranes
   In places where the skin is under friction – in the arm pits, in the groin, and especially near the genitalia and the buttocks, the rash becomes moist (moist papillae). Syphilitic rashes can appear and disappear again.
   In the period of secondary syphilis, the infected individuals easily spread the disease
3. Syphilitic papillae (condilomas) on female genitalia
4. Syphilitic rash on the skin
